

## Construction Comparison: Bottom Load Metal Construction vs. Molded

*ECO Environmental Filtration offers bottom load pleated bag replacements in metal construction and in molded construction.*

*The main, and most obvious, difference in the two constructions is the number of parts required for installation. The molded version is more simplified than the metal version.*

*However, there are certain applications where the constraints of the system will not allow the use of the molded version, such as chemical compatibility or temperature requirements.*

*Call us to discuss your needs so that we can provide the right design for application.*
